

ABSTRACT

A high chair clean seat is disclosed for use as a seat cover on a restaurant high chair for the purpose of protecting babies and toddlers from the dirt and bacteria left on those restaurant high chairs. The high chair clean seat comprises a continuous connected sleeve covering the entire seating area of a high chair including the sides, back, front, corners and seat bottom with leg openings provided for legs to slide through. The high chair clean seat cover comprises washable material, including woven washable material and non-woven washable material, so as to provide a simple method for covering restaurant high chairs. The one-piece construction of the high chair clean seat allows for easy installation while covering every portion of the restaurant high chair with which babies and toddlers can come into contact. Leg openings in the shape of semi-circles are provided. The high chair clean seat also comprises a strap and buckle for helping babies and toddlers sit more securely without using the soiled strap/buckle already found on restaurant high chairs. The strap/buckle system

secures to the high chair by means of a small button-hole/slit on the bottom of each side of the high chair clean seat. The high chair clean seat attaches to the high chair by means of its one-piece shape, fitting  
5 over the entire seating area frame with leg holes facing front. The one-piece shape of the high chair clean seat is square-like to be form-fitting. Hook and loop fasteners provided added adjustability for squirmy babies and toddlers.
